

Thermography is a non-invasive, radiation-free monitoring of breast health

### Breast Thermography

An indispensable method of breast assessment and breast cancer risk evaluation.

### Other Infrared Imaging Applications

Identification and monitoring of:

- Inflammatory conditions (Arthritis)
- Carpel Tunnel Syndrome
- Chronic Pain
- Complex Regional Pain Syndrome
- Musculoskeletal disorders (Fibromyalgia, Whiplash, Chronic back pain)
- Sports Injuries

For more information on adding Thermography to your practice, please contact us at:

Early Detection  
is important,  
but prevention  
is the key!

Breast Cancer is the most common cancer in women, and the risk increases with age.

Current research indicates that 1 in every 8 women will develop breast cancer in her lifetime.

## Breast Thermography

Breast Thermography is a breakthrough imaging procedure where infrared images of the breasts are analyzed and rated to determine the risk of developing breast cancer.

Thermography is non-invasive, safe and painless - no radiation or compression is used.

The infrared imaging process allows you to see the range and amount of heat or thermal energy emitted from the body.

Structural tests, such as mammograms and ultrasound rely on finding physical lesions (anatomy), while Breast Thermography detects asymmetrical blood vessel circulation (physiology) within the breast.

Thermography is based on the scientific premise that before the growth of the abnormal cells can occur, an increased blood supply must be circulated to the growth area.

Thermography measures the heat generated by the microcirculation of blood in the breast during this process.

## Early detection is important, but prevention is the key!

The advantage of an early assessment of risk factors could be life-saving. Breast Thermography is one of the best early-detection systems available today.

Studies have shown that:

- An abnormal infrared image is the single-most important marker of high risk for developing breast cancer.
- A persistent abnormal image carries with it a 22 times higher risk of developing future breast cancer.
- When thermography is added to a women's regular breast health checkup, a 61% increase in survival rates has been shown.
- When thermography is used as part of a multimodal approach (clinical examination, mammography and thermography) 95% of early-stage breast cancers can be detected.

## Who should have Breast Thermography testing?

- Women who want to take a pro-active approach to their health find great value in the additional information provided by Breast Thermography.
- Women who have had inconclusive mammograms or physical breast examinations find that Breast Thermography can help to clarify these tests, thus enabling women to better manage their breast health.
- Women with dense or fibrocystic breasts, where mammography is of little value, will benefit from thermographic monitoring.
- Young women - Breast Thermography can be safely performed on young pregnant women.
- In addition, early breast exams can provide a valuable baseline from which to measure future breast health and potential risk factors.
